

PROPOSED SOLUTION

Strategic Product Placement Analysis

Solution Overview

The proposed solution is an interactive retail analytics system that analyzes product placement and sales-related factors using Tableau. It transforms retail data into a dashboard and analytical story, then integrates the published visualizations into a Flask and Bootstrap web application. The solution is designed to make product performance comparisons clearer and support data-driven retail decisions.

1. RETAIL DATA ANALYSIS

Use the retail dataset to study product category, product position, sales volume, consumer demographics, foot traffic, product price, competitor price, promotion, and season.

2. INTERACTIVE TABLEAU DASHBOARD

Create multiple visualizations that answer business questions and combine them into a dashboard. Add filters so users can explore important retail dimensions interactively.

3. ANALYTICAL TABLEAU STORY

Organize selected visual findings into story scenes. The story guides users through important product placement and sales insights in a logical sequence.

4. FLASK WEB APPLICATION

Use Python and Flask to run the web application and render the main project template.

5. BOOTSTRAP USER INTERFACE

Use HTML, CSS, Bootstrap, and JavaScript to provide a clean interface with Home, About, Dashboard, Story, and Project Information sections.

6. TABLEAU WEB INTEGRATION

Embed the published Tableau dashboard and story into the Flask website while preserving dashboard filtering and story navigation.

SOLUTION WORKFLOW

How the Proposed Solution Works

STEP 1	Review retail data and identify the fields required for product placement analysis.
STEP 2	Prepare the data and define business questions related to sales, position, customers, traffic, pricing, promotions, and seasons.
STEP 3	Build Tableau visualizations and validate that each chart answers a specific business question.
STEP 4	Combine the visualizations into an interactive dashboard and add relevant filters.
STEP 5	Create a Tableau story to present selected insights in a structured sequence.
STEP 6	Publish the dashboard and story to Tableau Public.
STEP 7	Build the Flask and Bootstrap web interface and embed the published Tableau views.
STEP 8	Test navigation, dashboard filters, story scenes, layout, and overall project presentation.

Expected Benefits

Benefit	Value
Clear Analysis	Transforms complex retail data into understandable visual comparisons.
Interactive Exploration	Allows users to explore dashboard insights through filters.
Structured Insights	Uses Tableau Story to present important findings in sequence.
Better Presentation	Combines analytics and web integration in a single project interface.
Decision Support	Helps identify product placement and sales patterns that can support retail planning.

Final Proposed Solution

Develop a Strategic Product Placement Analysis web application that combines Tableau retail analytics with Flask and Bootstrap.

The solution provides an interactive dashboard for detailed exploration, a Tableau story for structured insight presentation, and a clean web interface for accessing the complete analysis. The final system focuses on product placement, sales volume, customer demographics, foot traffic, pricing, promotions, and seasonal patterns.
